

F1. Hook: Routing, Not Scale

Can we improve ETTh1 accuracy through routing design, not brute-force scaling?

Dense Scaling Path

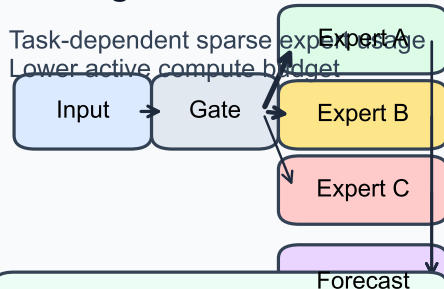

All-to-all communication
High global interaction cost

Complexity proxy: $O(N^2)$

Routing-Centric Path

Task-dependent sparse expert usage
Lower active compute budget

Complexity proxy: $O(k*N)$ with $k \ll N$

Observed (10-seed means): MAE 2.234 -> 1.438 (mean -> GRU), latency 0.326ms -> 2.564ms, FLOPs 2,960,608 -> 3,759,328
