

a Factorial design: bank alignment × routing

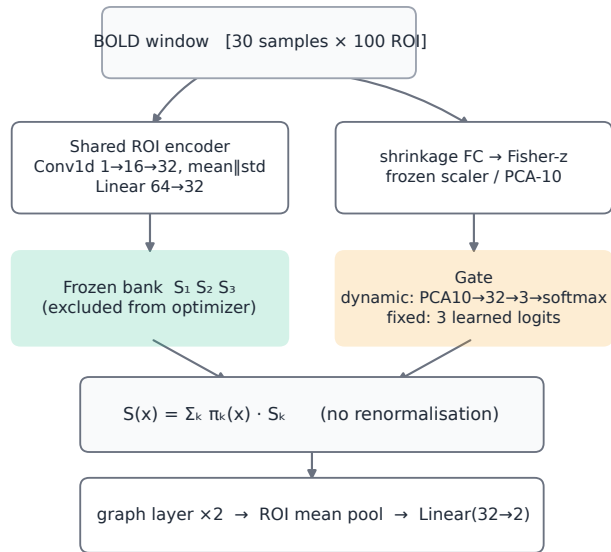

H1 $A - B > 0$ gain from FC-dependent routing

H2 $A - C > 0$ gain from an anatomically aligned bank

secondary $(A - B) - (C - D)$ interaction

$\delta = 0.02$ balanced accuracy; decision from the paired-bootstrap CI lower bound

b Shared forward path (common to A-D)

B and D compute FC but never route it into prediction

■ training-rest brain bank ■ ROI-permuted null bank ▨ fixed mixture (hatched)
