

a From runs to conclusions — required artefact per gate

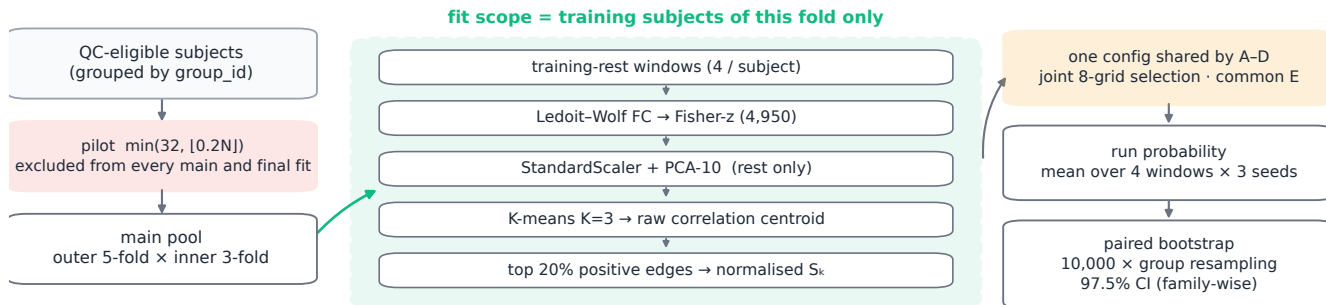

Current state: G0 blocked — no AOMIC source BOLD, sidecar JSON, confounds or events found locally (WI-01, measured).

No model sweep starts before G0 is resolved.

Significance is not an execution gate: with data and design locked, external validation proceeds even if internal results are negative.

b Fit boundary inside a fold — which subjects each component is fitted on

Rest scans of pilot, outer-test and inner-validation subjects never enter the scaler / PCA / K-means / bank fit; validation transforms never refit.

The statistical unit is the subject; window, seed and fold counts are never counted as N.
