

a Fixed-window rule — selected on the original acquisition clock

b Native TR confirmed — and what the existing extraction assumed instead

Every combination clears the 252 s requirement at its native TR, so the [12, 252] s window design holds without revision.

The existing extraction applied TR = 0.75 s to every run. It is correct only for PIOP1 restingstate; both primary targets were filtered at 2.67× the wrong rate.
